

Spider & Ant Barrier Spray

What is a Barrier Spray?

Barrier Sprays are exterior applications targeting the foundation, eaves, doorways, and around windows. These treatments prevent crawling insects from entering the home.

What insects are mainly targeted?

Barrier sprays do an excellent job in controlling crawling insects such as:

1. Spiders
2. Ants
3. Earwigs

When are Barriers applied?

Barrier applications can be applied once a problem is discovered, however, they are best applied as a preventative. In our region, ants are very active in the spring and summer, and spiders want to come inside prior to the Autumn freeze. Since both spider and ants are active all year, many of our customers desire to put on a program.

What does a program entail?

We recommend three treatments per season (*Spring, Summer, & Early Fall*). The people & pet friendly products generally last around 3 months.

Can you spray inside the home?

Yes, our applicators are licensed to treat baseboards and crawlspaces within the home. The products are generally dry in about 15 minutes.
